

2 GHz LOW NOISE PROGRAMMABLE DIVIDER (N = 1 to 4)

Typical Applications

The HMC794LP3E is ideal for:

- LO Generation with Low Noise Floor
- Clock Generators
- Mixer LO Drive
- Military Applications
- Test Equipment
- Sensors

Features

- Low Noise Floor: -163 dBc/Hz at 10 MHz offset and -160 dBc/Hz at 100 kHz offset
- Programmable Frequency Divider, N = 1, 2, 3 or 4
- 200 MHz to 2 GHz Input Frequency Range
- 50% Duty Cycle Outputs
- Up to +10 dBm Output Power
- Sleep Mode: Consumes <1 μ A
- 16 Lead 3X3 mm SMT Package: 9mm²

Functional Diagram

General Description

The HMC794LP3E is a SiGe BiCMOS low noise programmable frequency divider in a 3x3mm leadless surface mount package. The circuit can be programmed to divide from N = 1 to N = 4 in the 200 MHz to 2 GHz input frequency range. The high level output power (up to 10 dBm) with a very low SSB phase noise and 50% duty cycle makes this device ideal for low noise clock generation, LO generation and LO drive applications. Configurable bias controls allow power minimization of up to 20%.

Electrical Specifications, $T_A = +25^\circ C$, $V_{cc} = +5V$, $Z_O = 50\Omega$, $Bias1 = GND$

Application Note:

The HMC794LP3E is a high performance RF divider. Such dividers are high gain devices with internal feedback. The device will oscillate if used with AC coupled RF inputs and if no RF input is applied. Normally, if the RF input signal is removed the device should be disabled, or it should be placed in divide by 1 mode. The device is stable in divide by one mode with no RF input. The device will oscillate in divide 2, 3, or 4 modes with no RF input. In general very small RF input levels will stop all oscillations. At the minimum rated RF input sensitivity level or higher, no oscillations or spurious signals exist and excellent low noise performance is achieved.

For input frequency lower than 200 MHz, square wave input signal is recommended.

The divider output power for the differential mode, shows a roll off at lower frequencies due to the limited frequency range of the T6 & T7 (4:1) RF transformers, 500 MHz to 3000 MHz.

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and backside ground paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.

[1] For single ended operation perform the following modifications to this assembly:

- 1) Remove T6 and T7, C4 and C6
- 2) Install 0Ω resistors (jumpers) over the following pads:
 - a) Pads 1 and 2 on T6 location
 - b) Pads 5 and 6 on T6 location
 - c) Pads 2 and 3 on T7 location
 - d) Pads 4 and 6 on T7 location
- 3) Install 100pF cap in location C99
- 4) Install jumper wire at location Pad 1 on T7 to Ground. Remove solder mask to reveal ground plane in this area.
